

From now on: $\underline{n=2}$ will be our setting.

More on measure zero:

Thm: Let $\Omega \subsetneq \mathbb{O}$, $\Omega \subseteq \mathbb{R}^2$ & let $\bar{\Omega} \setminus \Omega$ is of measure zero.
 \uparrow bdd
 \uparrow open

Suppose $f \in B(\Omega)$ & $f|_{\Omega}$ is continuous. Then
 $f \in R(\Omega)$.

Remark: (1) Recall: Riemann-Lebesgue thm says: $f \in B(\mathbb{B}^2) \iff f \in R(\mathbb{B}^2) \iff$ the set of discontinuity of f is of measure zero.

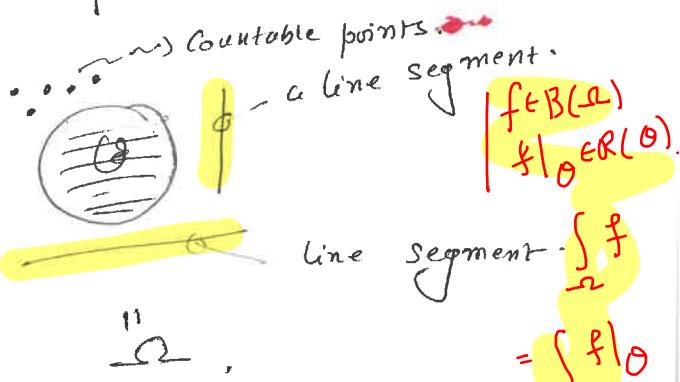

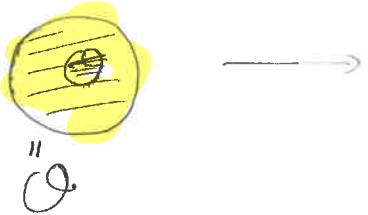

(2) From this perspective: the above thm is different:
 Ω is a bdd subset of \mathbb{R}^2 .

(3) In particular: Consider a continuous fn. f on $\Omega \subseteq \mathbb{R}^2$.
 \uparrow open

Any extension (but bdd) of f to any bdd.

Set Ω s.t. $\bar{\Omega} \setminus \Omega$ is of measure zero will be integrable.

e.g:

(4) We are hoping the following:

Let $f \in R(\Omega)$ & let Ω is of measure zero.
 \uparrow bdd

Should
be
useful.

Then $\cancel{f \in R(\Omega)}$

$$\int_{\Omega} f = 0.$$

$$\int_{\mathbb{B}^2} f = ?$$

$\mathbb{B}^2 \supseteq \Omega$

Proof. Consider a box B^2 s.t. $\text{int}(B^2) \supseteq \bar{\Omega}$. Recall $\tilde{f} \in \mathcal{B}(B^2)$

is the extension of f :

$$\tilde{f}(x, y) = \begin{cases} f(x, y) & \forall (x, y) \in \bar{\Omega} \\ 0 & \forall (x, y) \in B^2 \setminus \bar{\Omega} \end{cases}$$

Note that $\tilde{f}|_{\text{int}(B^2) \setminus \bar{\Omega}} = 0$. $\& \text{int}(B^2) \setminus \bar{\Omega}$

an open set. Thus $\tilde{f}|_{\text{int}(B^2) \setminus \bar{\Omega}}$ is cont. fn. on

$\text{int}(B^2) \setminus \bar{\Omega}$.

Moreover, $\bar{\Omega}$ is of measure zero $\Rightarrow \bar{\Omega}$ is of measure zero.

[HPW] \rightarrow Easy. ($n > 1$)

~~∴~~ \because the set of points of discontinuity of \tilde{f} (namely $\bar{\Omega}$) is of measure zero, it follows

that $\tilde{f} \in R(B^2)$.

To prove: $\int_{B^2} \tilde{f} = \left(\int_{\bar{\Omega}} f \right) = 0$: Let $\epsilon > 0$. $\sum_{\alpha \in \tilde{\Lambda}}$

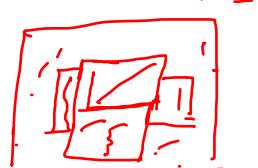

Set $M = \sup_{\bar{\Omega}} |f|$.

Now for $\epsilon > 0$, \exists a partition P of B^2 s.t.

$$\sum_{\alpha \in \tilde{\Lambda}} \text{vol}(B_\alpha^2) < \epsilon \quad \& \quad \bigcup_{\alpha \in \tilde{\Lambda}} (B_\alpha^2) \nsubseteq \bar{\Omega}.$$

(for some $\tilde{\Lambda} \subseteq \Lambda(P)$).

In fact: get a finite cover of $\bar{\Omega}$ with total area $< \epsilon$ $\&$ then ~~new~~ add some more sub-boxes to cover the entire B^2 : that will be the partition P .]

Recall: if $f \in R(\Omega)$, then $|f| \in R(\Omega) \wedge \left| \int_{\Omega} f \right| \leq \int_{\Omega} |f|$.

general fact.

$$\begin{aligned}
 \text{Here: } U(|\tilde{f}|, P) &= \sum_{\alpha \in \Lambda(P)} M_{\alpha} v(B_{\alpha}^2) \\
 &\quad \uparrow P, \text{ as above.} \\
 &= \sum_{\alpha \in \tilde{\Lambda}} M_{\alpha} v(B_{\alpha}^2) \quad \because M_{\alpha} := \sup_{B_{\alpha}^2} |\tilde{f}| \\
 &\quad = 0 \quad \forall \alpha \notin \tilde{\Lambda} \\
 &\leq M \times \sum_{\alpha \in \tilde{\Lambda}} v(B_{\alpha}^2). \\
 &< M \times \varepsilon. \\
 \Rightarrow \inf U(|\tilde{f}|, P) &= 0 \quad \Rightarrow \int_{B^2} \tilde{f} = 0. \\
 &\Rightarrow \int_{\Omega} \tilde{f} = 0. \quad \square
 \end{aligned}$$

Back to our thm:

Thm: $\Omega \supseteq \Omega$. Suppose $\bar{\Omega} \setminus \Omega$ is of measure zero,

\uparrow bdd. \uparrow open

$f \in B(\Omega) \wedge f|_{\Omega}$ is continuous. Then $f \in R(\Omega)$.

Proof: Let $\text{int}(B^2) \supseteq \bar{\Omega}$ & consider \tilde{f} on B^2 (extension of f).

Enough to prove that: \mathcal{D} , the set of points of discontinuity of \tilde{f} , is of measure zero.

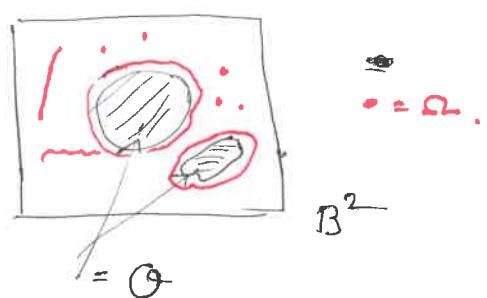

Note that: (i) $\tilde{f}|_{\Omega}$ is cont. (ii) $\tilde{f}|_{\text{int}(B^2) \setminus \bar{\Omega}} = 0$ is cont.

& (iii) $\tilde{f}|_{\partial B^2} = 0$ cont.

$\Rightarrow \mathcal{D} \subseteq \bar{\Omega} \setminus \Omega \leftarrow$ set of measure zero.

$\Rightarrow \mathcal{D}$ is a set of measure zero.

$\Rightarrow f \in R(\Omega)$.

DANGER: Sets of measure zero depends on the "dimension".

For instance: ① $[0,1] \subseteq \mathbb{R}$ is not of zero measure

but $[0,1] \times \{a\} \subseteq \mathbb{R}^2$ is of measure zero.

② $\mathbb{Q} \cap [0,1]$ is of measure zero? Y/N:

③ $\mathbb{Q} \times \mathbb{Q} \cap ([0,1] \times [0,1])$ — II —? Y/N:

Fact: Let $f: B^2 \rightarrow \mathbb{R}$ be a cont. fn. Then

Graphs have
measure zero.

$$\text{graph } f := \{(x, f(x)) : x \in B^2\} \quad (\subseteq \mathbb{R}^3)$$

is a set of measure zero.

Proof: Let $\varepsilon > 0$. Note that: f is uniformly cont.

$$\therefore \exists s > 0 \text{ s.t. } |f(x) - f(y)| < \varepsilon \quad \forall |x-y| < s. \quad (x, y \in B^2)$$

Next, on this $s > 0$, pick a partition P of B^2 (we can do it)

s.t. the diameter of $B_\alpha^2 < s$ $\forall \alpha \in \Lambda(P)$.

$$\Rightarrow |f(x) - f(y)| < \varepsilon \quad \forall x, y \in B_\alpha^2, \alpha \in \Lambda(P).$$

$$\text{Set } I_\alpha := \{f(x) : x \in B_\alpha^2\}.$$

The range set of $f|_{B_\alpha^2}$. $\Rightarrow I_\alpha \subseteq \tilde{I}_\alpha$, an interval of length at most ε . $\forall \alpha$.

$\therefore \{B_\alpha^2 \times \tilde{I}_\alpha : \alpha \in \Lambda\}$ is a cover of boxes of graph f . Also:

$$\begin{aligned}
 \sum_{\alpha \in \Lambda(P)} v(B_\alpha^2 \times I_\alpha) &= \sum_{\alpha \in \Lambda(P)} v(B_\alpha^2) \times v(I_\alpha) \\
 &\leq \sum_{\alpha \in \Lambda(P)} v(B_\alpha^2) \times \varepsilon. \\
 &= \underbrace{v(B^2)}_{\text{Constant}} \times \varepsilon.
 \end{aligned}$$

\Rightarrow measure of graph f is zero. \square

In fact, we have the following:

Better!! Let $f \in R([a, b])$. Then $G_f := \{(x, f(x)) : x \in [a, b]\} \subseteq \mathbb{R}^2$ is of measure zero.

Proof. We proceed along the same line:

Let $\varepsilon > 0$. $\exists P \in \mathcal{P}([a, b]) \ni$

$$U(f, P) - L(f, P) < \varepsilon.$$

Set $P: a = x_0 < x_1 < \dots < x_n = b$.

$$\forall B_i^2 := [x_{i-1}, x_i] \times [m_i, M_i],$$

$$\text{Here: } m_i = \inf_{[x_{i-1}, x_i]} f$$

$$M_i = \sup_{[x_{i-1}, x_i]} f.$$

$$\therefore G_f \subseteq \bigcup_{i=1}^n B_i^2. \quad \text{Finally:}$$

$$\begin{aligned}
 \sum_{i=1}^n v(B_i^2) &= \sum_{i=1}^n v([x_{i-1}, x_i] \times [m_i, M_i]) \\
 &= \sum_{i=1}^n (x_i - x_{i-1}) \times (M_i - m_i).
 \end{aligned}$$

$$= U(f, P) - L(f, P)$$

$$< \varepsilon.$$

\square

Smart proof?
Then P-42?

Back to Fubini's thm:

Recall: Let $f \in \mathcal{R}(B^2)$. Set $B_2 = [a,b] \times [c,d]$.

If $\int_a^b f(x,y) dx$ exists $\forall y \in [c,d]$, then

$$\int_{B^2} f = \int_c^d \left(\int_a^b f(x,y) dx \right) dy, \quad \text{--- (1)}$$

likewise if, $\int_c^d f(x,y) dy$ exists for each $x \in [a,b]$, then

$$\int_{B^2} f = \int_a^b \left(\int_c^d f(x,y) dy \right) dx. \quad \text{--- (2)}$$

If $f \in C(B^2)$, then $(1) = (2)$.

→ → → .

Q: Fabini for $f \in \mathcal{R}(\Omega)$, $\Omega \subseteq B^2$, bdd ??

How to think about it?

In fact: it is not easy to "evaluate" double integral over Ω COMPUTE

$\Omega \subseteq \mathbb{R}^2$. However, with "some" control over Ω ,

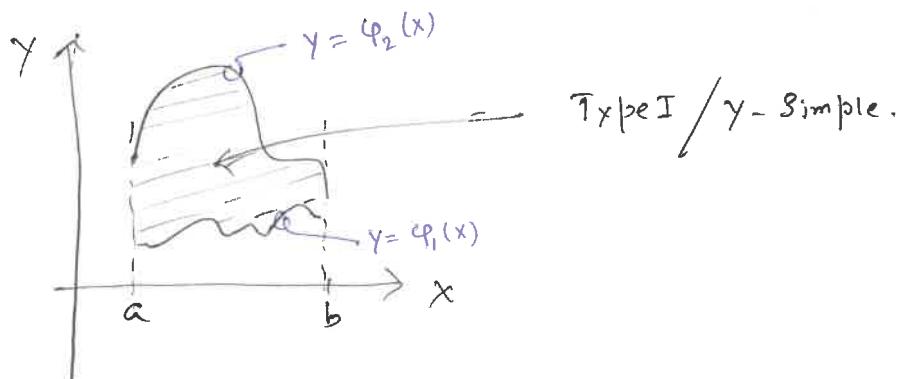

one can do "Something". It is as follows:

Two Special domains (AKA: Elementary regions) :

Def: A set $\Omega \subseteq \mathbb{R}^2$ is said to be y-Simple / Type I if $\exists \varphi_1, \varphi_2 \in \mathcal{R}([a, b])$ s.t.

$$\Omega = \left\{ (x, y) \in \mathbb{R}^2 : a \leq x \leq b, \varphi_1(x) \leq y \leq \varphi_2(x) \right\}.$$

Here:

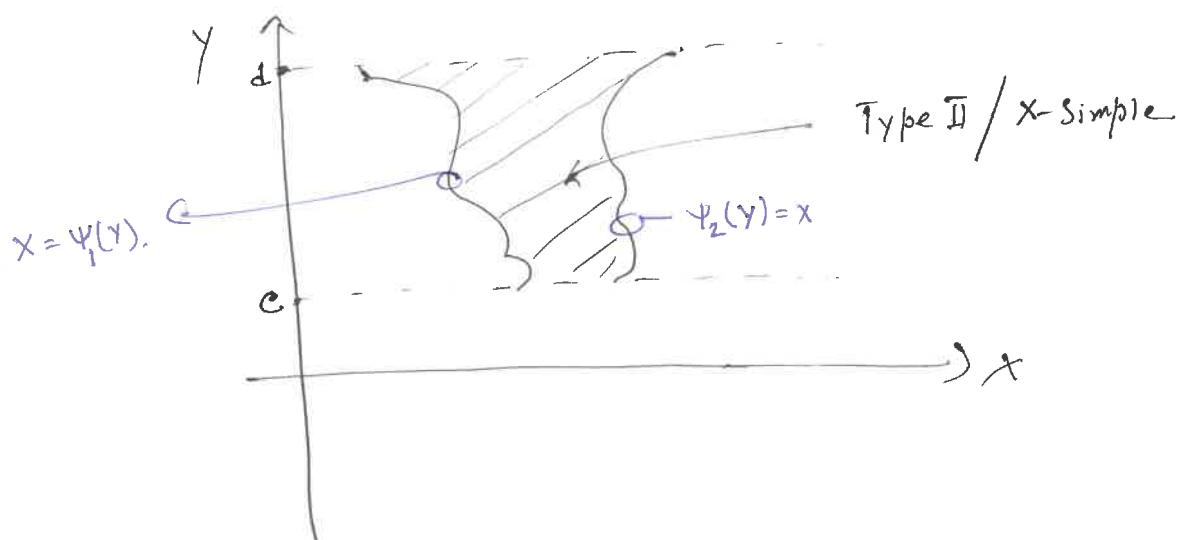

1/4 x-Simple / Type II regions are given by:

$$\Omega = \left\{ (x, y) \in \mathbb{R}^2 : c \leq y \leq d, \psi_1(y) \leq x \leq \psi_2(y) \right\}$$

for some $\psi_1, \psi_2 \in \mathcal{R}[c, d]$.

Here:

e.g:
